

Get Out of the Way, Hawaii—

# Alaska Edging Toward Tropics; Will Take Awhile Arriving

The Geological Survey reported results of studies made by its Dr. Warren Hamilton indicating that much of the variation in climate during the geologic past has been caused primarily by the movement of continents.

Dr. Hamilton believes that

Alaska has been bent southward into the Pacific Ocean in times past and that southern Alaska is still sliding southward past the northern part of the state.

According to this study continental drift continues at the rate of a few feet or a few yards per century.
