

THE GAS SQUEEZER: The Central Gas Compressor Plant is located on Atlantic Richfield's side of the Prudhoe Bay Field and is comprised of 30 large modular buildings. Eight of these modules make-up the Field Fuel Gas Unit which will provide natural gas for all Prudhoe facilities and four pump stations along the trans Alaska pipeline. The remaining gas will be reinjected into a sub-surface reservoir through injection wells that are being drilled by two rigs in the far background. The Prudhoe Bay Field contains 26 trillion cubic feet of gas.
